

performed under general anesthesia in a supine 25° reverse Trendelenburg position. An abdominal pneumoperitoneum (12mmHg) was established. We used 4 trocars for exposing the herniated sigmoid colon and a laparoscopic approach. We placed a total of 3 layers of sutures with absorbable knots. We placed an absorbable hydrophilic mesh (Sofradim, Trévoux, France) using an internal hernia clips® (Sofradim, France). The operation time was 46 min. The patient is in good health after surgery in good health.
